

The spatial arrangement of forest patches in the Semideciduous forest zone of Ghana. All forest patches >100 ha known to occur north of the dashed line are depicted. Patches sampled for birds are indicated by crosses (≤ 10 ha, $n = 13$), circles (20-700 ha; $n = 9$) and squares (≥ 1000 ha; $n = 13$). Triangles indicate patches >1000 ha that were not sampled for birds. Tic marks are about 60 km apart. Rectangle below indicates approximate area depicted above.
